important aspects of hearing science and to help established investigators to better understand the fundamental theories and data in fields of hearing that they may not normally follow closely. Each volume presents a particular topic comprehensively, and each serves as a synthetic overview and guide to the literature. As such, the chapters present neither exhaustive data reviews nor original research that has not yet appeared in peer-reviewed journals. The volumes focus on topics that have developed a solid data and conceptual foundation rather than on those for which a literature is only beginning to develop. New research areas will be covered on a timely basis in the series as they begin to mature.

The Body in Medical Thought and Practice - D. Leder 2013-06-29

In the second half of the 20th century, the body has become a central theme of intellectual debate. How should we perceive the human body? Is it best understood biologically, experientially, culturally? How do social institutions exercise power over the body and determine norms of health and behavior? The answers arrived at by phenomenologists, social theorists, and feminists have radically challenged our conventional notions of the body dating back to 17th century Cartesian thought. This is the first volume to

systematically explore the range of contemporary thought concerning the body and draw out its crucial implications for medicine. Its authors suggest that many of the problems often found in modern medicine -- dehumanized treatment, overspecialization, neglect of the mind's healing resources -- are directly traceable to medicine's outmoded concepts of the body. New and exciting alternatives are proposed by some of the foremost physicians and philosophers working in the medical humanities today.

The list of abbreviations is repeated below and the acknowledgements are completed. The former classifications of subfamilies or tribes are already rather of historical importance; however, in almost every one there are

some important facts or interesting interpretations. Within a few last years there has been a consensus in almost all classifications problems. The most actual is the proposal of arrangement of the family-level taxa by Horak (1999) which is also followed in this paper. Contents include: Introduction, Systematics, System of the European Tortricidae, Systematic list of Olethreutinae, Olethreutinae, Plates of Genitalia, Plates of Adults, List of Plants, References, Index."

- Arnold Hauser 2018-12-07

It contains philosophical reflections on history and begins with chapters on the scope and limitations of a sociology of art, and the concept of ideology in the history of art. The chapter on the concept of "art history without names" occupies the central position in the book — thoroughly discussing the basic philosophical outlook for the whole work. There are also further chapters on psychoanalysis, folk art and popular art. The chapter on the role of convention in the history of art points the way for

The Last Execution - Jesper Wung-Sung 2016-03-22
Called “brilliantly devastating” in a starred review from Kirkus Reviews, this award-winning, mesmerizing novel, based on the chilling true story of the last execution in Denmark’s history, asks a question that plagues a small Danish town:

does a fifteen-year-old boy deserve to be put to death? On February 22, 1853, a fifteen-year-old Niels Nelson is prepared to be executed on Gallows Hill. The master carpenter comes to measure Niels for his coffin. The master baker bakes bread for the spectators. The messenger posts the notice of execution in the town square. The poet prepares his best pen to record the events as they unfold. A fly, Niels’s only companion in the cell, buzzes. A dog hovers by his young master’s window. A young girl hovers too, pitying the boy. The executioner sharpens his blade. This remarkable, wrenching story is told with the alternating perspectives of eleven different bystanders—one per hour—as the clock ticks ever closer to the moment when the boy must face his fate. Niels Nielson, a young peasant, was sentenced to death by beheading on the dubious charges of arson and murder. Does he have the right to live despite what he is accused of? That is the question the townsfolk ask as

the countdown begins. With strong social conscience, piercing intellect, and masterful storytelling, Jesper Wung-Sung explores the age-old question: who determines who has the right to live or die?

The Lateral Line System provides an overview of the key concepts and issues surrounding the development, evolution, neurobiology, and function of the lateral line, a fascinating yet somewhat enigmatic flow-sensing system. The book examines the historical precedence for linking the auditory and lateral line systems, its structure and development, use of the lateral line system of zebrafish as a model system, physical principles governing the response properties of the lateral line, the behavioral relevance of this sensory system to the lives of fish, and an examination of how this information is shaped and encoded by the peripheral and central nervous systems.

Improving Learning in College

- Roz Ivancic 2009-03-04

What's the problem with literacy at college? How might everyday literacy be harnessed for educational ends? Based on the first major study of literacy practices in colleges in the UK, this book explores the reading and writing associated with learning subjects across the college curriculum. It investigates literacy practices in which students engage outside of college, and teaching and learning strategies through which these can help support the curriculum. With insightful analyses of innovative practices, it considers ways of changing teaching practices to enable students to draw upon their full potential. Recent research work has challenged the myth of individual student deficit, arguing cogently that people have 'funds of

knowledge' from diverse and vibrant cultural roots, and that these have been misguidedly disqualified by the education system. It has claimed that different 'ways with words' can provide valuable resources for learning. However, the empirical exploration of this claim has lagged far behind the theoretical debate. Improving Learning in College resolves this by showing the integrity and richness of the literacy practices of a significant population, not previously the focus of such research: those who take vocational and academic college courses in colleges. It addresses an issue which has not until now been developed within this research tradition: that of how these practices can not only be valued and validated, but mobilised and harnessed to enhance learning in educational settings. This book will interest all teachers, teacher-educators and researchers concerned with post-compulsory education and vocational education in compulsory schooling.

Sensory Processing in Aquatic Environments -

Shaun P. Collin 2008-04-08

Research on sensory processing or the way animals see, hear, smell, taste, feel and electrically and magnetically sense their environment has advanced a great deal over the last fifteen years. This book discusses the most important themes that have emerged from recent research and provides a summary of likely future directions. The book starts with two sections on the detection of sensory signals over long and short ranges by aquatic animals, covering the topics of navigation, communication, and finding food and other localized sources. The next section, the

co-evolution of signal and sense, deals with how animals decide whether the source is prey, predator or mate by utilizing receptors that have evolved to take full advantage of the acoustical properties of the signal. Organisms living in the deep-sea environment have also received a lot of recent attention, so the next section deals with visual adaptations to limited light environments where sunlight is replaced by bioluminescence and the visual system has undergone changes to optimize light capture and sensitivity. The last section on central co-ordination of sensory systems covers how signals are processed and filtered for use by the animal. This book will be essential reading for all researchers and graduate students interested in sensory systems.
